Title :	Swimming ponds and natural swimming pools - Requirements for planning, construction, operation and Rehabilitation		
Scope :	This document regulates the requirements for artificially created bathing waters that are sealed against the ground and protected from the surrounding area, which are treated by biological or biological-mechanical purification (plants, animals, biofilm, microorganisms). This applies exclusively to privately used facilities. Bathing areas in natural waters are not covered by this document. Classified swimming pools are not covered by this document; they are dealt with in ÖNORM EN 15288-1 and ÖNORM EN 15288-2. Garden ponds, fish ponds, ponds with inflow, pools, small bathing ponds and preserved or disinfected pools are also not covered by this document.

Title : Small natural swimming ponds - Requirements for planning, design, operation, rehabilitation and monitoring
Scope : This document regulates the requirements for artificially created bathing waters that are sealed off from the subsoil, with or without technical facilities, and supplied with water. Water treatment is carried out on a biological basis. This document applies to the planning, construction, operation and renovation of small bathing ponds that fall under the provisions of the Bathing Hygiene Act (e.g. municipalities, hotels, campsites, residential complexes with 6 or more residential units, commercial enterprises, clubs).

Title : Metal hanging constructions and fastening systems in swimming pools - Requirements and inspections

Scope : NEN 9200 specifies which metals are permitted for suspension structures and fasteners in indoor swimming pools. It also describes how inspections of suspension structures and fasteners should be designed and carried out. The aim of this standard is to promote safety in swimming pools. Simple inspections can identify and verify the materials used in swimming pools.

Title : Energy performance of buildings - Determination method

Scope : The new calculation method succeeds NTA 8800 and stems from the European EPBD IV directive. Its aim is to provide a transparent, unambiguous, and harmonized European method for assessing building energy performance that better reflects actual energy use. The method applies to all building types-both new and existing-and covers both energy labeling and requirements for new construction. It provides a more realistic picture of actual energy consumption by better aligning with average building usage, employing a different calculation for system efficiency, and accounting for future climate trends.

Title :	Methods of structural analysis to verify steel structures		
Scope :	The subject matter of this Technical Standardization Information (TNI) is the application of analysis methods for the verification of the ultimate limit state of steel structures in accordance with STN EN 1993-1-1: 2023. The TNI contains numerical examples demonstrating the application of the following methods: M0, M1, M2, M3, M4, UGLIIM Alternative A (e0d,m syM1 = 1,1), and UGLIIM Alternative A (e0d,m syM1 = 1,0). The TNI provides an assessment of the above-mentioned methods and compares their results with those obtained using Method M5 with elastic–elastic spatial imperfections and the finite element method (FEM) using GMNIA with plastic-plastic spatial imperfections. The results obtained are verified by independent calculations using computer programs.

Title :	Wooden buildings. General requirements for design, manufacture, installation and inspection		
Scope :	This standard applies to the design, manufacture, assembly, quality control, operation and maintenance of timber buildings. In particular, the standard specifies requirements for building structures that separate the external environment from the internal environment of buildings, or that separate two different climatic environments within the interior of buildings. The standard defines the specific characteristics of timber buildings that are not addressed in greater detail by other standards for design and construction. It takes into account and complements the key set of Eurocodes EN 1995, standards related to fire safety, standards related to the thermal protection of buildings, as well as standards related to window and door openings and lightweight external wall systems. The standard specifies the basic requirements for all materials and building structures forming a timber building. The main focus of the standard is to ensure requirements concerning physical integrity, optimisation, and the reduction or elimination of thermal bridges and vapour-diffusion-related connections. The standard provides design options for combustible assemblies, non-combustible assemblies, mixed assemblies, fasteners and escape routes in timber buildings from the perspective of fire safety, in accordance with applicable legislation. The standard establishes a structural basis for calculation procedures and for the dimensioning of all necessary related elements. It contains basic instructions and diagrams of typical details of timber buildings, as well as representative construction details. The purpose of the standard is to establish a framework for eliminating moisture-related problems in wall and roof		

assemblies between the interior and exterior, to establish a framework for addressing moisture-related problems in timber structures with regard to the specific properties of wood, and to establish the technical identification of materials within building-envelope assemblies.

Title :	Precast concrete elements for funerary structures		
Scope :	This standard specifies the requirements applicable to precast concrete elements used in funerary structures intended to accommodate coffins, funeral urns, human remains (either bodies or skeletal remains) or cremated remains (ashes), as well as the remains of domestic animals where permitted by the applicable legislation. The following elements are included, among others:– niches;– burial vaults or underground burial units;– graves;– columbaria;– ossuaries;– mausoleums;– other prefabricated funerary construction systems. This standard also applies to complementary precast concrete elements associated with such structures, including:– closing slabs or cover slabs;– base slabs;– cornices;– roof elements;– side panels;– ventilation or passive ventilation elements. This standard specifies:– the design requirements		

for precast concrete elements;– the criteria for the assessment and verification of constancy of performance (AVCP);– the requirements for product marking and identification;– the technical documentation to be provided by the manufacturer;– the conditions for supply and acceptance;– the basic instructions for installation. This standard does not replace the structural design of the funerary structure where such a design is required by the applicable regulations.

Title : Durability of timber and wood-based materials in construction.

Scope : The purpose of this standard is to estimate the durability of timber components used in construction, both in new builds and in those parts of refurbishment works where new timber is used. It applies to both structural and non-structural elements. This standard utilises the Use Classes system set out in standard UNE-EN 335, which establishes criteria for identifying the different service conditions to which timber and timber-based products may be exposed, specifying the biological agents that may be present in each situation. The activity of xylophagous insects (with the exception of termites and marine organisms) is not so much linked to the service conditions set out in the UNE-EN 335 standard as to their presence in the geographical location where the timber element is situated and to the existence, or otherwise, of physical or chemical barriers that prevent insects from entering the timber. Therefore, the activity of xylophagous insects must be considered as a potential cross-cutting issue across all service conditions.

Title : Cable accessories. Elements of connection to be used in low and medium voltage underground distribution networks up to 18/30 (36) kV. Part 1: General requirements

Scope : The purpose of this standard is to define the characteristics that connection components intended to connect cables to electrical equipment and electrical cables to one another must possess, and the tests they must pass.

The scope of this standard covers accessories intended for single-core cables used in the distribution of electrical energy in low- and medium-voltage networks up to 18/30 (36) kV, and includes the following:

- Compression terminals.
- Mechanical clamping terminals.
- Compression-type splice connectors.
- Mechanical clamping-type splice connectors.
- Compression-type branch connectors (for use in low-voltage networks).
- Compression-type branch connectors with insulation piercing (for use in low-voltage networks).
- Mechanical clamping-type branch connectors (for use in low-voltage networks).
- Connection elements for detachable connectors.

Title : Cable accessories. Connection assemblies to be used in underground distribution networks with cables of rated voltage 0,6/1 kV
Scope : This standard specifies the characteristics that connection assemblies (enclosure and connecting element) for underground low-voltage electricity distribution networks must meet and the tests they must pass.

This standard applies to connection assemblies (enclosures and connection elements) for joints, branches and terminations of single-core cables with aluminium conductors, in accordance with Standard UNE-HD 603, Parts 5N and 5X.

The designation of the preferred constructions for the fittings in this standard indicates the range of maximum and minimum permissible cross-sections for each model. It does not imply that the fitting is designed for use with all intermediate cross-sections.

This standard does not apply to connection elements supplied separately, which are governed by the UNE 211024 series of standards, nor to insulated connections, which are governed by the UNE 211022 standard.

Title :	Methodology for the verification and inspection of low voltage electrical installations in operating theatres and intervention rooms.
Scope :	This standard is intended to provide criteria for the verification and inspection of low-voltage electrical installations in operating theatres and procedure rooms: – by providing a methodology for verification/inspection; and – providing documentation for recording the conditions and values of the verification/inspection (non-conformities observed, damage, deterioration and hazardous conditions, etc.). The results of the verifications/inspections must define the corrective actions to be taken to comply with the minimum safety requirements for this type of installation. This standard applies to electrical installations in operating theatres and procedure rooms covered by ITC BT 38 of the REBT of 2002, whether they are powered by an isolation transformer or not (group 2 or group 1). This standard also includes checking the maintenance logbook for the checks to be carried out before and after the installation is put into service. Operating theatres and procedure rooms may be included in locations affected by ITC-BT standards other than ITC-BT 38 (e.g. public buildings, etc.). For such installations, the relevant parts of the UNE 202009 series of standards must also be used.
