Title : Food and feed industry premises Minimum requirements, procedures, tools and criteria for implementing pest control systems – Insects and rodents
Scope : his standard specifies the method for designing and implementing pest monitoring systems (insects and rodents) applicable to the premises of organizations operating in the food and feed sectors, from post-harvest storage through to the subsequent stages of transport, production, handling, storage, sale, distribution, and service.
The objective is to define the minimum requirements for obtaining representative data on the presence of pests in processing environments and equipment, in order to prepare an accurate technical assessment and enable the organization to undertake appropriate preventive and corrective actions, as well as integrated (IPM - Integrated Pest Management) to bring pest levels back to acceptable thresholds, thereby reducing the risk of infestation and food and feed contamination.

Title : Geotechnical investigation and testing - Identification and classification of soil - Part 1: Identification and description (ISO 14688-1:2017)
Scope : This document specifies the rules for the identification and description of soils and is intended to be read in conjunction with ISO 14688-2, which outlines the basis of classification of those material characteristics most commonly used for soils for engineering purposes. The relevant characteristics could vary and therefore, for particular projects or materials, more detailed subdivisions of the descriptive and classification terms could be appropriate.
This document specifies procedures for the identification and description of soils based on a flexible system for use by experienced persons, covering both material and mass characteristics by visual and manual techniques. Details are given of the individual characteristics for identifying soils and the descriptive terms in regular use, including those related to the results of hand tests carried out in the field as part of the descriptive process.
This document is applicable to the description of soils for engineering purposes which can be those laid by natural processes, those laid by man or comprise synthetic materials.

Title : Geotechnical investigation and testing - Identification and classification of soil - Part 2: Principles for a classification
Scope : This document specifies the basic principles for classification of those material characteristics most commonly used for soils for engineering purposes. It is intended to be read in conjunction with ISO 14688-1, which gives rules for the identification and description of soils. The relevant characteristics could vary and therefore, for particular projects or materials, more detailed subdivisions of the descriptive and classification terms could be appropriate. Due to differences in local geological conditions, practices to enhance relevant classification criteria are used.
The classification principles established in this document allow soils to be classified into groups of similar composition and geotechnical properties, based on the results of field and laboratory tests with respect to their suitability for geotechnical engineering purposes.
This document is applicable to natural soil in situ, natural soil reworked artificially and synthetic materials. A more detailed classification specific to use in earthworks is given in EN 16907-2.

The present National Annex defines classification of soil which are relevant in Austria.

Title :	Procedure for regulatory inspection. Storage of chemical products. Part 10: Specific requirements for storage in mobile containers		

Scope : This standard establishes the systematic procedure to be followed by inspectors when conducting the initial and periodic inspections required by current regulations or ordered by the Competent Authority, in order to verify compliance with regulatory requirements for the storage of chemicals in portable containers.

This regulation establishes the specific inspection terms that apply and the requirements for the storage of hazardous chemicals in portable containers.

This regulation applies without prejudice to any other regulations and procedures developed

by the competent authority of the autonomous community where the storage facility is located.

This regulation also applies to periodic inspections and reviews of chemical storage facilities covered by the scope of application of previous, now-repealed regulations on the storage of chemicals in portable containers. Table I of Article 2 of the RAPQ is included as Table A.1 in Informative Annex A.

This regulation applies to periodic inspections of chemical storage facilities covered by the scope of previous, now-repealed regulations on the storage of chemicals in portable containers, to which the technical specifications set forth in ITC-MIE APQ 1, 2, 4, 6, and 7 apply.

Any activities related to the design, manufacture, and conformity assessment of storage equipment and facilities, as well as alternative technical solutions, are excluded from the scope of this standard.

National Ref : PNE 56427
Title : Durability of timber and wood-based materials in construction.
Scope : The purpose of this standard is to estimate the durability of timber components used in construction, both in new builds and in those parts of refurbishment works where new timber is used. It applies to both structural and non-structural elements.
This standard utilises the Use Classes system set out in standard UNE-EN 335, which establishes criteria for identifying the different service conditions to which timber and timber-based products may be exposed, specifying the biological agents that may be present in each situation. The activity of xylophagous insects (with the exception of termites and marine organisms) is not so much linked to the service conditions set out in the UNE-EN 335 standard as to their presence in the geographical location where the timber element is situated and to the existence, or otherwise, of physical or chemical barriers that prevent insects from entering the timber. Therefore, the activity of xylophagous insects must be considered as a potential cross-cutting issue across all service conditions.

Title : Industrialized construction systems for buildings made from precast concrete products. Performance, production, installation and verification requirements
Scope : This standard defines the requirements for performance, manufacturing, assembly, and verification of industrialized building systems constructed from precast concrete elements.

Compliance with these requirements will ensure that the industrialized system possesses the characteristics and performance necessary to meet—either on its own or through the addition of other complementary elements (such as thermal insulation, acoustic insulation, and waterproofing elements)—the regulatory and functional requirements applicable in

each case. When the industrialized system requires the addition of these complementary elements to meet such requirements, this standard provides for the possibility that such addition may take place at the factory by incorporating the complementary elements into the precast concrete elements, or by incorporating them during the assembly of the industrialized system itself.

Title : Gas boiler rooms and enclosures for industrial use
Scope : This standard establishes the safety requirements applicable to rooms and enclosures housing industrial-use boilers with a combined nominal useful output exceeding 70 kW that utilize gaseous fuels from the families defined in Standard UNE-EN 437.This standard does not apply to premises where the following types of gas-fired equipment are installed:
– generators intended for heat or cold production using a heat-transfer fluid (excluding air but including steam at a maximum working pressure of 0.5 bar or less) with a combined nominal useful output exceeding 70 kW, or cogeneration equipment with a combined nominal heat input exceeding 70 kW; the requirements for these are governed by Standard UNE 60601;
– industrial equipment other than boilers (such as furnaces, hot-air generators, laundry equipment, dryers, paint booths, etc.); the requirements for these are governed by Standard UNE 60670-6;
– appliances not intended for industrial use; the requirements for these are governed by Standard UNE 60670-6;
– boilers forming part of the operational process of an electric power plant, oil refinery, or petrochemical plant subject to pressure equipment regulations.However, when boilers covered by this standard coexist in the same room or enclosure with other gas-consuming equipment, the ventilation conditions are determined by the sum of the individual nominal consumption rates of all such equipment.

Title :	Cable accessories. Elements of connection to be used in low and medium voltage underground distribution networks up to 18/30 (36) kV. Part 1: General requirements		

Scope :

The purpose of this standard is to define the characteristics that connection components intended to connect cables to electrical equipment and electrical cables to one another must possess, and the tests they must pass.

The scope of this standard covers accessories intended for single-core cables used in the distribution of electrical energy in low- and medium-voltage networks up to 18/30 (36) kV, and includes the following:

– Compression terminals.

– Mechanical clamping terminals.

– Compression-type splice connectors.

– Mechanical clamping-type splice connectors.

– Compression-type branch connectors (for use in low-voltage networks).

– Compression-type branch connectors with insulation piercing (for use in low-voltage networks).

– Mechanical clamping-type branch connectors (for use in low-voltage networks).

– Connection elements for detachable connectors.

Title :	Cable accessories. Elements of connection to be used in low and medium voltage underground distribution networks up to 18/30 (36) kV. Part 2: Compression fittings.		

Scope :

This Part 2 of the UNE 211024 standard, which must be read in conjunction with Part 1, aims to define the characteristics that compression-type connection fittings intended for connecting cables to electrical equipment and electrical cables to one another must meet, and the tests they must pass.

This standard does not apply to connectors for bare conductors and RZ-type overhead cables (which have been designed to specific mechanical requirements).

Title : Cable accessories. Connection assemblies to be used in underground distribution networks with cables of rated voltage 0,6/1 kV

Scope : This standard specifies the characteristics that connection assemblies (enclosure and connecting element) for underground low-voltage electricity distribution networks must meet and the tests they must pass.

This standard applies to connection assemblies (enclosures and connection elements) for joints, branches and terminations of single-core cables with aluminium conductors, in accordance with Standard UNE-HD 603, Parts 5N and 5X.

The designation of the preferred constructions for the fittings in this standard indicates the range of maximum and minimum permissible cross-sections for each model. It does not imply that the fitting is designed for use with all intermediate cross-sections.

This standard does not apply to connection elements supplied separately, which are governed by the UNE 211024 series of standards, nor to insulated connections, which are governed by the UNE 211022 standard.

Title : Air purity protection -- Determination of benzene in workplace by gas chromatography with flame ionization detection or with mass spectrometry
Scope : This standard gives a method for determination of benzene (CAS: 71-43-2) in workplaces air by gas chromatograph with flame ionization detection or with mass spectrometry. The method is applicable during control of the hygienic-sanitary conditions. The lowest concentration of benzene which can be determined by the method in the sampling and determination conditions specified in the standard is 0,066 mg/m³ (for air volume 9 l).
